The problem

Leader Election

IEEE 1394, also known as FireWire is a standard for high-speed serial bus communication. It is commonly used in audio and video equipment. In such networks devices are hot-pluggable, meaning they can be added or removed at any time without disrupting the system's operation. However, such changes trigger a bus reset, and after the reset, all nodes within the network are restored to an equal status, requiring a new leader to be elected dynamically.

Agenda

- 1 The Problem
- 2 The Contribution**
- 3 Motivation/Importance
- 4 Background/Previous Works
- 5 Contribution
- 6 Experimental results/Proofs
- 7 Conclusions

What is the solution/contribution

- Implementation of Leader Election Algorithm on the AHCv2 platform.
- Anlysis of the algorithms within different topologies

Agenda

- 1 The Problem
- 2 The Contribution
- 3 Motivation/Importance**
- 4 Background/Previous Works
- 5 Contribution
- 6 Experimental results/Proofs
- 7 Conclusions

Motivation/Importance - 1

The bus resets that happen after an audio or video plug-in can be disruptive, causing interruptions in the system's operation. Think as when you are on your computer watching a video you unplug your headphone and your system freezes for 3-4 seconds. That is not a situation anyone wants.

Motivation/Importance - 2

The IEEE 1394 leader election protocol dynamically assigns leadership status after bus resets, the protocol creates uninterrupted communication and coordination among interconnected devices. This is crucial for the seamless exchange of digitized video and audio signals in various electronic devices.

Agenda

- 1 The Problem
- 2 The Contribution
- 3 Motivation/Importance
- 4 Background/Previous Works**
- 5 Contribution
- 6 Experimental results/Proofs
- 7 Conclusions

Background-1

The IEEE 1394 standard mentions about the problem under the concept of isochronous resource manager (IRM) selection. It also provides examples of processes for selecting the IRM within a backplane environment. However, it doesn't go into the algorithmic details of how the selection process should be implemented.

Background-2

Additionally, Devillers et al., formalizes a simple algorithm for this IEEE standard protocol. This paper addresses ambiguities and challenges encountered during the process. The authors of the paper especially focuses on the tree identify phase. This paper serves as formal verification of this distributed algorithm. We will also use their method in our implementation.

Agenda

- 5 Contribution**
- 6 Experimental results/Proofs
- 7 Conclusions

Protocol

The protocol operates in a decentralized manner where nodes in the network coordinate to form a tree structure. When a node has received a parent request from all but one of its neighbors it sends a parent request to its remaining neighbor. If a node has received parent requests from all its neighbors, it knows that it has been elected as the root of the tree. There are 3 main states for every node of the algorithm

Algorithm-1

Leader Election in IEEE 1394

Listing 1: Leader Election algorithm in IEEE 1394.

```
1 Implements:
2 Uses:
3     send_message, # sends message to given neighbor for asking parentage
4     send_ack_message, # sends message to given neighbor for accepting parentage
5     set_timer, # set timer after the timer ends that uses the given function with given
6     arguments.
7     remove_timer, # remove timer for that neighbor
8 Events:
9     Init,
10    MessageNeighbor,
11    OnMessageFromNeighbor,
12    OnReceivingAcknowledgementMessageFromNeighbor,
13    OnReceivingParentageRequestFromNeighbor,
14 Needs:
15     adjacent_nodes_set: ans,
16     my_node_id: my_node_id
17 OnInit: () do
18     parent = None
19     message_queue_set = set()
20     remaining_ans = ans.deep_copy()
21     remaining_neighbor_count = remaining_ans.length()
22     If remaining_neighbor_count == 1: # becomes a leaf
```

(continues on next page)

Algorithm-2

(continued from previous page)

```

23         last_neighbor = remaining_ans.first()
24         MessageNeighbor(last_neighbor)
25
26     MessageNeighbor: ( x ) do
27         If my_node_id < x:
28             parent = x
29             send_message(x) # will u be my father
30             set_timer(x, MessageNeighbor, x)
31             message_queue_set.add(x)
32
33     OnMessageFromNeighbor: ( message, x ) do
34         If message is 'acknowledgement':
35             OnReceivingAcknowledgementMessageFromNeighbor(x)
36         Else If message is 'parentage request':
37             OnReceivingParentageRequestFromNeighbor(x)
38
39     OnReceivingAcknowledgementMessageFromNeighbor: (x) do
40         remove_timer(x)
41         message_queue_set.remove(x)
42         parent = x # lifecycle of this node ends
43
44     OnReceivingParentageRequestFromNeighbor: (x) do
45         neighbor_is_the_father = False
46         If parent == x: # parent chosen as x before thus contention
47             neighbor_is_the_father = True
48             send_message(x)
49         Elif x in message_queue_set: # other party whose id is lower chosen me as parent.
50             thus contention
51             remove_timer(x)
52             message_queue_set.remove(x)
53             root = my_node_id # root is chosen if it is needed for everyone to know.
54             broadcast message can be added
55
56     If not neighbor_is_the_father:
57         remaining_ans.remove(x)
58         remaining_neighbor_count -= 1
59         send_ack_message(x)
60         If remaining_neighbor_count == 1: # becomes a leaf
61             last_neighbor = remaining_ans.first()
62             MessageNeighbor(last_neighbor)

```

States

- Waiting for Children
- Sending Parent Request
- Parent Contention(only for last 2 nodes)

- We know that for a graph to be fully connected and acyclic, it must have exactly $N-1$ connections
- If a graph has no non leaf nodes it means that it has at least $2N$ edges which will surely make it cyclic thus contradiction
- Since it is not cyclic some of the nodes has to be leafs at every iteration.
- Only leafs sends request to possible parents.
- When a node chooses its parent(it has to be acknowledged) it is eliminated from this process.

Agenda

- 1 The Problem
- 2 The Contribution
- 3 Motivation/Importance
- 4 Background/Previous Works
- 5 Contribution
- 6 Experimental results/Proofs**
- 7 Conclusions

After every elimination there are 3 cases:

- Either there are at least one previous leaf remaining(in this case at least one of these chooses its parents)
- There is no previous leaf remaining but since these leaf nodes are removed from our calculation new leafs are created
- Parent chosen process ends

because of above reasons this algorithm is correct. Since for every node to choose its parent. There should be exactly one of its neighbors that has not chosen it as parent. Which means up to root contention the subtrees will merge and at last point one of the roots of these subtrees will become the leader.

In addition to above, for contention instead of using randomized waits I chose to appoint node with higher number as root. To do this:

- In case the current node having lower id. It first appoints the neighbor as its root then sends parentage request. In the case of receiving a root request from said node, it resends root request to that neighbor forcing parentship until acknowledgement received.
- In case the current node having higher id. It sends parentage request. In the case of receiving a root request from said node instead of acknowledgement, immediately accepts.

- In case of contention(last 2 nodes) since lower id forces parentage, higher id will receive parentage request at some point and acknowledge it ending the cycle.
- In case of no contention even if it is lower or higher id since the other node doesn't send a request back it will acknowledge the parentage request.

Conclusions

Hindsight is Clearer than Foresight

Advices come from [?].

- You can now make observations that would have been confusing if they were introduced earlier. Use this opportunity to refer to statements that you have made in the previous three sections and weave them into a coherent synopsis. You will regain the attention of the non- experts, who probably didn't follow all of the Technicalities section. Leave them feeling that they have learned something nonetheless.
- Give Open Problems It is traditional to end with a list of open problems that arise from your paper. Mention weaknesses of your paper, possible generalizations, and indications of whether they will be fruitful or not. This way you may defuse antagonistic questions during question time.
- Indicate that your Talk is Over An acceptable way to do this is to say "Thank-you. Are there any questions?"[?]

How to prepare the talk?

Please read <http://larc.unt.edu/ian/pubs/speaker.pdf>

- The Introduction: Define the Problem, Motivate the Audience, Introduce Terminology, Discuss Earlier Work, Emphasize the Contributions of your Paper, Provide a Road-map.
- The Body: Abstract the Major Results, Explain the Significance of the Results, Sketch a Proof of the Crucial Results
- Technicalities: Present a Key Lemma, Present it Carefully
- The Conclusion: Hindsight is Clearer than Foresight, Give Open Problems, Indicate that your Talk is Over
